In re page 10, applicant's representative states: "Clearly, these claims contemplated that the protection information be added to the input signal that is converted and that the limitations as to copying be determined from that added signal."

The examiner notes that copy protection information, if it exists in an image signal, is always added to that image signal. That is, once an image has been generated, copy protection data or other signals are added to that signal. This may be done by the producer before release to the public, it may be done by a broadcaster, it may be done by a digital reproducer in response to metadata in the stored data signal, or at any other point in the chain from the original shots to the final display. The invention, as claimed, does not declare any particular stage as being the point where protection data is added to the input signal. Since Nguyen reads a copy protection codefrom the DVD that is not part of the original raw image, that code clearly has been added to the signal, at least during the transfer to DVD, and therefore meets the limitations of the claimed invention.

In re page 11, applicant's representative states: "There is not the slightest suggestion that the converter itself should block in the converted signal under any circumstances, or that this could be of any benefit."

The examiner notes that, as written, claim 1 recites separate signal conversion means, determination means, prohibiting means, and notification means. The invention does not involve a converter blocking any converted signal.
